

Dota 2 Bounty Hunter Guide

Mastering the Shadows: The Definitive Dota 2 Bounty Hunter Guide

In the ever-evolving battleground of Dota 2, few heroes embody the thrill of the hunt quite like Gondar, the Bounty Hunter. For years, this stealthy assassin has been a staple of the competitive and pub meta, not necessarily for his ability to delete heroes in a single combo, but for his unparalleled capacity to generate gold and map pressure. Whether you are a seasoned veteran looking to refine your roamer or a new player wanting to understand the art of disruption, a well-structured **Dota 2 Bounty Hunter Guide** is essential. This article will walk you through every nuance of the hero, from the laning stage to the late game, ensuring you can maximize his potential to tilt the economy in your team's favor.

Bounty Hunter is often misunderstood. Many players see the Jinada critical strike and Track kill bounty and assume he is a hard carry. In reality, he is a tempo-setting initiator and a space creator. His strength lies in making the enemy team terrified to farm alone, while simultaneously setting his team up for massive gold swings. Let us dive deep into the mechanics, strategies, and itemization that define this elusive hero.

Understanding Bounty Hunter's Abilities

Before stepping into the jungle or the safelane, you must understand the toolkit at your disposal. Bounty Hunter’s abilities are designed for harassment, burst damage, and vision control.

Shuriken Toss (Q)

This is Bounty Hunter's primary nuke. Shuriken Toss throws a magical shuriken that bounces to Tracked targets. The key here is synergy. If you cast Track on an enemy, your Shuriken will not only hit that target but will bounce to any other Tracked enemies within range. This allows for significant multi-target damage during skirmishes and team fights. The cast animation is snappy, making it a reliable tool for securing kills from the fog of war.

Jinada (W)

Jinada is a passive ability that functions as a built-in critical strike and a slow. Every few seconds, your next attack will deal bonus physical damage and slow the enemy's move speed. This is your primary laning harassment tool and your gap-closer mechanism. The slow allows you to get more attacks in or land a follow-up Shuriken Toss. In the early game, a Jinada proc can take a quarter of a support's HP bar, zoning them out of

experience range.

Shadow Walk (E)

Arguably the most iconic ability in the game, Shadow Walk grants Bounty Hunter invisibility and a burst of move speed. Breaking the invisibility with an attack deals bonus damage, making it a strong initiation tool. This ability is not just for escaping; it is for repositioning, scouting, and setting up kills. A common mistake is using it only for survival. Use it to walk past enemy wards, place deep vision, or flank the enemy carry during a creep wave push.

Track (R)

The ultimate ability, Track, is the backbone of the hero's identity. When cast on an enemy, it reveals them, grants True Sight (meaning you can see invisible units), and provides a massive move speed bonus to Bounty Hunter while moving toward the target. Upon the enemy’s death, Bounty Hunter and all nearby allies receive a bounty of gold. This ability scales directly into the late game, ensuring that even if you fall behind in kills, a single team fight victory can catapult your team into a net worth lead. The vision provided by Track is invaluable for preventing ganks and catching split pushers.

The Optimal Skill Build for Bounty Hunter

The skill build for Bounty Hunter is surprisingly flexible, but there is a standard approach that works in the majority of pubs and competitive games.

1. **Level 1:** Start with **Jinada**. The first creep wave is critical. A single Jinada hit on the enemy offlaner often secures the lane equilibrium for your carry. The slow also helps secure the first bounty rune or prevent a first blood escape.
2. **Level 2:** Take **Shadow Walk**. This gives you a "get out of jail free" card. You can use it to de-ward the small camp or to rotate mid without being seen.
3. **Level 3:** Take a second point in **Jinada**. The damage and slow duration scale reliably, increasing your kill threat.
4. **Level 4:** Take **Shuriken Toss**. By now, the laning stage is concluding, and you need the nuke damage for securing ranged creeps and participating in skirmishes.
5. **Level 5:** Another point in **Jinada**.
6. **Level 6:** Unlock **Track**. This is your power spike. As soon as you have Track, your job shifts from laning to roaming.

After level 6, the build becomes situational. Generally, maximum Jinada and Shuriken Toss is standard, but if you are struggling to survive, a value point in Shadow Walk is fine. The talent tree also offers flexibility. The level 10 talent for +25 movement speed is generally superior for roaming, while the +75 Shuriken Toss damage is great for burst.

Item Builds: From Poverty to Riches

Itemization on Bounty Hunter revolves around two phases: the "poor man's" early game and the "rich man's" late game. Despite being a gold generation hero, he needs specific cheap items to function.

Starting Items

- **Tangoes** and a **Quelling Blade** (if you plan to do some lane cutting or securing last hits).
- **Orb of Venom**: This is a core starting item. It stacks with the Jinada slow, making it incredibly difficult for enemies to escape your harass.
- **Two Iron Branches** or a **Mantle of Intelligence** for stats.
- A **Sentry Ward** (always buy one to de-ward the lane).

Core Early Game Items

- **Phase Boots**: The move speed and damage are crucial. Phase Boots allow you to get in position for Jinada procs and chase down tracked targets. They have largely replaced Power Treads due to the need for burst mobility over attack speed.
- **Orb of Corrosion**: This item is incredible on Bounty Hunter. It provides armor, mana regen, and an even stronger slow. It allows you to completely control the movement of any hero you hit.
- **Magic Wand**: Essential for mana management. You will be spamming Shuriken Toss and Shadow Walk, and the burst health and mana can save your life.

Core Mid Game Items

- **Desolator**: If you are having a great game, Desolator provides armor reduction that makes your Jinada hits devastating. It also helps your team push towers faster after a kill.
- **Black King Bar (BKB)**: Bounty Hunter is squishy. If the enemy team has stuns or magic nukes, a BKB is non-negotiable. It allows you to run at the enemy backline without being locked down.
- **Aghanim's Scepter**: This is a game-changer. Aghanim's increases Track duration and gives you a third charge of Shadow Walk. It also allows you to use Track to break enemy items (like BKB or Linken's). The extra mobility is insane.

Late Game and Luxury Items

- **Silver Edge**: This upgrades your Shadow Walk, providing a break effect. This is crucial against heroes like Bristleback, Spectre, or Legion Commander.
- **Assault Cuirass**: If your team is physical damage heavy, this provides armor and attack speed.
- **Butterfly**: For raw damage and evasion against right-click carries.
- **Nullifier**: Great for locking down slippery supports who rely on items like Ghost Scepter or Eul's Scepter.

It is vital to remember that Bounty Hunter is a **utility/roaming** hero first. Do not be afraid to buy **Glimmer Cape**, **Force Staff**, or **Lotus Orb** if your team needs the save.

The gold you generate via Track means you can afford to buy support items while still getting your core damage.

Laning Stage: Disruptor and Harasser

In the laning stage, your goal is not to farm the creeps. Your goal is to make the enemy offlaner's life a living hell. You want to secure the safelane farm for your carry.

Position yourself in the trees or near the river entrance. When the enemy offlaner steps up to deny a creep or contest a last hit, walk out and hit them with Jinada. The slow from Jinada combined with your Orb of Venom means they will only get one attack off before they have to retreat. Repeat this process. Every time Jinada is off cooldown, it is your window to trade.

If the enemy offlaner is a strong dual lane (like Mars and Skywrath), your priority shifts to survival. Use Shadow Walk to scout the runes and to place a ward that protects your carry. Do not die for the sake of harass. A dead Bounty Hunter in the laning stage is a disaster because you give up gold and experience.

At level 6, you should be looking for the first rotation. Tell your mid laner you are coming. Use Shadow Walk to walk up to the enemy mid, cast Track, hit them with Jinada, and then throw Shuriken Toss. The kill is almost guaranteed. Once you have a kill, use the momentum to take the enemy's mid tower or to empower the offlane.

Mid Game: The Map is Your Domain

The mid game is where Bounty Hunter shines brightest. You are no longer a laner; you are a map-wide threat. Your job is to constantly pressure the enemy cores as they try to farm.

Here is the golden rule of the mid game: **Do not show on the minimap**. If the enemy sees you, they know where to play safe. If they do not see you, they must play scared. Use Shadow Walk to cut creep waves behind the enemy tower. If a support walks out to pull the camp, jump them. If the enemy carry is farming a "dead lane" (a lane that is pushed too far), run at them with Track.

Your ultimate is on a relatively short cooldown. Do not save it exclusively for kills. Use Track on enemy heroes to give your team vision of their movement. If you see the enemy Tidehunter walking into the smoke, you can warn your team to back off. The vision advantage from Track is often more valuable than the gold.

Ward placement is also critical. You are the best de-warder in the game. Because you are invisible, you can risk walking into the enemy jungle to place an observer ward on a high ground cliff where enemy sentries are likely placed. This vision control allows your team to make picks and take Roshan safely.

Bounty Hunter is not a front-line fighter. Do not stand next to your tank and trade blows. In a team fight, you want to be on the periphery, looking for a key target to isolate.

Wait for the fight to break out. Once the enemy has committed their stuns and disables

onto your tank or your carry, that is your cue. Shadow Walk onto their support or their squishy core (like Sniper or Drow Ranger). Cast Track, hit them with Jinada, and then immediately Shuriken Toss. If they are low, they die. If they are not, you Shadow Walk away and look for another angle.

Desolator is fantastic for this playstyle because the armor reduction benefits your
