Importance of the Manual

Safety is paramount when operating any generator. The **manual for a 1850 Coleman Powermate generator** contains specific safety instructions that you must follow. Here is a summary of the most critical points:

Proper Starting Procedure

- Place the generator outdoors in a dry, well-ventilated area away from windows, doors, and vents.
- Check the oil level and fuel level. Use the recommended oil viscosity from the manual.
- Turn the fuel valve to the “ON” position.
- Set the choke to the “START” position (usually full choke when cold).
- Pull the recoil starter cord gently until resistance is felt, then pull sharply.
- Once the engine starts, gradually move the choke to the “RUN” position.
- Allow the engine to warm up for a few minutes before connecting any loads.

Electrical Load Management

Your manual for a 1850 Coleman Powermate generator will list the maximum current for each outlet. Never exceed these ratings. Use a heavy-duty extension cord rated for outdoor use and ensure it is fully unwound to prevent overheating. Add loads in sequence, starting with the largest motor-driven appliance (which requires the most starting surge).

Shutdown and Storage

- Disconnect all loads before turning off the generator.
- Let the engine run at no load for a minute or two to cool down.
- Turn the fuel valve to the “OFF” position and allow the carburetor to run dry.
- Turn the engine switch to “OFF” (if equipped).
- Store the generator in a clean, dry area. If storing for more than 30 days, add fuel stabilizer to the tank following the manual’s instructions.

Maintenance and Service Intervals from the Manual

Regular maintenance is the key to long generator life. The **manual for a 1850 Coleman Powermate generator** provides a schedule that, if followed, will keep your machine starting and running reliably for decades.

Oil Changes

Most manuals recommend changing the engine oil after the first 5-8 hours of operation (break-in period) and then every 50 hours or every season, whichever comes first. Use high-quality SAE 30 or 10W-30 detergent oil. Never overfill; check the dipstick level carefully.

Air Filter Maintenance

Check the foam air filter every 25 hours of operation in normal conditions, and more frequently in dusty environments. Clean it with warm, soapy water, rinse thoroughly, and allow it to air dry

completely. Lightly oil the foam with engine oil and squeeze out excess before reinstalling. Replace the paper air filter element if your model has one. The manual will specify the correct filter part number.

Spark Plug Service

Remove and inspect the spark plug every 100 hours. Clean it with a wire brush and check the gap with a feeler gauge
